# Oceans

Oceans cover about 71 percent of Earth's surface. There are five oceans: the Pacific, Atlantic, Indian, Southern and Arctic, and the Pacific is by far the largest. The deepest known point, the Challenger Deep in the Mariana Trench, lies nearly 11,000 metres below the surface. The blue whale lives in the oceans and is the largest animal known to have ever existed, growing up to about 30 metres long. Oceans store huge amounts of heat and help shape weather and climate all over the world.
